From Middle School to Master's Degree:  
A Vertically Integrated Pathway for Industrial Cybersecurity Education

Sean McBride\*

La Trobe University

Corey Schou

Idaho State University

\* This work supported by a scholarship from La Trobe University

Abstract – this paper describes efforts currently underway at Idaho State University to establish a vertically integrated pathway to identify and develop industrial cybersecurity talent that extends from middle school to graduate degrees, leveraging the unique strengths of career and technical education. Educators and administrators seeking to ignite student interest in cybersecurity at a young age, and to provide a clear curriculum pathway to meet employer needs in the field of cybersecurity may also find these efforts of use.

## **Introduction**

A key critique of cybersecurity education in 2020 is that it does not account for the educational and training pathways of many industrial professionals [1]. These professionals frequently come from two-year technology programs, and develop by spending significant time on the plant floor. As their career progresses, they may become field engineers, and eventually managers. A review of the ABET web site shows 89 accredited technology programs in the United States that produce electrical engineering technicians [2].

While ad-hoc lifelong learning and professional training offered by commercial providers such as SANS [3] help address this challenge, we assert that critical cyber-physical infrastructures such as electric generating facilities, water provisioning systems, and oil refineries will benefit most from incorporating robust cybersecurity education and training into the formalized pathways that technical professionals frequently follow.

In this paper we propose a vertically integrated pathway to address this challenge, based on the experience of Idaho State University.

## **ISU's Involvement in Cybersecurity Education**

As noted in [25] Idaho State University has a distinctive, if little known, history in cybersecurity education, beginning at the foundation of the field, and extending to a specialized focus on critical infrastructure and industrial control systems.

- In 1988 a group of cybersecurity professionals meeting at Idaho State University formalized plans to create the International Information Systems Security Certification Consortium (ISC)<sup>2</sup> – the world's leading cybersecurity a body – which has certified 150,000 cybersecurity professionals [4].

- In the 1990s Idaho State University (ISU) held educational standards development sessions to create the National Security Telecommunications and Information Systems Security Committee (NSTISSC) and Committee on National Security Systems (CNSS) training guidance [23].
- These NSTISSC and CNSS instructions became the content criteria for designating schools as Centers of Academic Excellence in Information Assurance (now Cybersecurity) [5, 6].
- In 1996, ISU helped found the Colloquium for Information Systems Security Education (CISSE) [7, 8].
- In 2003, Idaho State University was among the first seven schools in the USA to be designated Centers of Academic Excellence (CAE) in Information Assurance [9].
- In 2014, recognizing growing need, ISU became one of just two CAEs to ever qualify with a focus on Industrial Control Systems and SCADA Security [24].

### **Southeast Idaho as a Talent Hotbed for Industrial Cybersecurity**

The Idaho National Laboratory (INL) is the most significant cybersecurity employer in the state of Idaho, with more than 150 employees dedicated to the field. These employees work primarily in Idaho Falls, just a 45 minute drive from the ISU main campus in Pocatello, and immediately adjacent to and ISU remote campus known as University Place. A brief review of INL's history in industrial cybersecurity provides important context for the integrated pathway we describe:

- In 2003, the Idaho National Laboratory, relying on several ISU graduates, became a principal location of the Department of Energy's National SCADA Testbed effort to secure industrial control systems [10, 11].

- From 2009 to 2015, the Idaho National Laboratory ran significant portions of the Department of Homeland Security's Industrial Control Systems Computer Incident Response Team (ICS-CERT) [12].
- In 2011, the New York Times ran an article which suggested that the INL had been involved in developing the famous Stuxnet computer virus that the US Government used to disrupt a nuclear weapons uranium enrichment plant in Iran [13], indicating its reputation as a leader in the field, and implying its involvement in broader government-sponsored cyber operations.
- In 2016, the INL published launched its Consequence Driven Cyber Informed Engineering (CCE) methodology for integrating engineering principles into security reviews of the nation's most critical industrial control system infrastructures [26-27]. Building on these accomplishments, the INL anticipates significantly increasing its cybersecurity workforce over the next several years. Employers from across the United States recruit from the Idaho Falls area, often allowing employees to work remotely.

As the nearest public university, ISU desires to 1) create a pathway for industrial cybersecurity talent to meet demand from INL and 2) create an exemplar curriculum and industry/academic relationship to display how the curriculum can be applied to industry problems worldwide. In 2015, Idaho State University's College of Technology became the first public school in the country to offer a Degree in Industrial Cybersecurity) [14]. The foundation of ISU's pathway development effort consists of vertical integration facilitated through career and technical education (CTE).

## Vertical Integration

Vertical Integration refers to intentionally coordinated relationships among instructors from different stages of the educational process, as shown in Table 1. These relationships – spanning institutional boundaries – allow faculty to clearly indicate the next steps an interested student may consider.

	<b>Institution Type</b>	<b>Faculty Role</b>	<b>Vertical Integration Actions</b>
Stage 1	Middle/High School	STEM-related instructor	<ul style="list-style-type: none"> <li>• Co-teach at college summer camp</li> <li>• Invite college instructor to visit classroom</li> <li>• Incorporate college program content</li> </ul>
Stage 2	Technical College	Program Coordinator	<ul style="list-style-type: none"> <li>• Co-teach with HS instructor at summer camp</li> <li>• Serve on HS advisory committee</li> <li>• Lead hands-on experiences in HS classrooms</li> <li>• Provide program tours</li> <li>• Invite employer to visit</li> <li>• Invite employer to advisory committee</li> </ul>
Stage 3	University	Major Faculty Advisor	<ul style="list-style-type: none"> <li>• Articulate with college programs</li> <li>• Coordinate scholarships for desired pathways</li> <li>• Introduce to student to graduate faculty</li> </ul>
Stage 4	Employer	Hiring Manager	<ul style="list-style-type: none"> <li>• Support summer camp with funds or other contributions</li> <li>• Participate on college program advisory committee</li> <li>• Visit college classroom</li> <li>• Provide internships</li> <li>• Hire graduates</li> </ul>
Stage 5	Graduate School	Graduate Supervisor	<ul style="list-style-type: none"> <li>• Meet promising undergraduates</li> <li>• Coordinate course offerings (times, locations, topics) with local employers</li> </ul>

Speaking from the authors' empirical observation as students, graduate students, professionals, and instructors, the prevailing formalized educational model focuses on what a student learns within each stage – and often within a particular component of the stage – without

intentional focus on transition between stages. Let's consider a hypothetical case of how improved vertical integration could benefit a middle school student, Alice.

In a required math class, Alice learns of a hands-on STEM summer camp opportunity from her teacher, who hands out a promotional flyer. Alice attends the camp, where she meets a high school teacher (helping run the camp) who encourages Alice to take the teacher's class as an elective. Even though two years go by, Alice sees the same teacher in the hall, and decides to sign up for her class. There, Alice participates in a hands-on activity brought to the school by a technical college instructor, who leaves behind contact information and promotional materials. The high school teacher coordinates a field trip to tour the college program. Alice attends the tour, likes what she sees, and enrolls.

During the college program, Alice hears from various employers who come to speak and seek potential new hires. She ends up interning with one of these employers. The employer recognizes Alice's great potential, and offers her a full-time job. She chooses instead to stay in school believing that a bachelor degree will serve her better in the long run. Her instructor points out which upper division classes will ensure employability. While taking these classes, her faculty advisor at the bachelor level offers to introduce Alice to a graduate-level faculty friend at another institution. Simultaneously, the company with which Alice first interned, offers her a full-time job at a higher wage, and describes its educational benefit that will pay for her to take a part time Master's Degree. Alice takes the job and signs up for online Master's classes.

In this scenario (summarized in Figure 1), it was the vertical integration (in addition to appropriate instruction), that ensured Alice obtained a job, the employer obtained an employee, and the graduate program continued advancing employee value.

*Figure 1. Vertically integrated pathway from student perspective*

### **Career and Technical Education (CTE)**

Career and Technical Education refers to educational approaches that openly incorporate hands-on methods, emphasizing the link to employable competencies [15]. In Idaho, candidacy for becoming a CTE instructor requires not a degree, but years of experience in the field.

Industry professionals and hiring managers who have an interest in producing strong entry-level employees help guide program curriculum by participating on advisory committees [16]. CTE instructors exist at both secondary (high school) and post-secondary (college) levels. Most post-secondary degree programs offer Associate's Degrees, and are accredited by the same accrediting bodies as many academic programs. For example, ABET accredits both technical 2-year programs, and bachelor programs in engineering and technology fields, including cybersecurity [17].

Idaho State University has a unique strength in that it's College of Technology is a technical college embedded within the university structure – see Figure 1. This allows the school to offer hands-on programs and laboratory learning experiences often missing from purely academic university programs. Literature explains that such hands-on experience is desirable for cybersecurity, and particularly desirable for cyber-physical systems [18-20].

While most high school and college students have used a computer that controls information and have some sense of security (at least how passwords work) far fewer have used a programmable logic controller that controls production in an industrial facility – like those used in Idaho to process potatoes. It may be difficult to commence a career securing devices that one has never before seen, let alone never handled and experienced.

ISU's Energy Systems Technology and Education Center (ESTEC) within the College of Technology has the mission of creating hands on technicians and field engineers that work in power plants, water treatment facilities, and manufacturing facilities [21]. ESTEC has instructional laboratory space designed to produce technicians in mechanical engineering, electrical engineering, instrumentation engineering, and nuclear operations.

*Figure 2. ISU Organizational Structure*

### **Raspberry Pis and Dehydrated Potatoes**

Content for vertical integration revolves around ESET 181: IT-OT Fundamentals. The premise of this, project-based course is that students design and build a notional industrial control system based on the needs of a real local potato processing firm – Basic American Foods (BAF). Students read local press articles explaining that BAF is closing one facility in favor of

increasing automation at another. They visit the BAF web site to see the products the firm produces.

Through a series of 43 hands-on learning activities, students rely on Raspberry Pis to explore and experience: IT-OT environments, computing platforms & operating systems, coding, basic process control, web technologies, supervisory control and data acquisition (SCADA), networking, industrial networks, the IT-OT gap, network monitoring, security, and the future of OT. At the end of the semester, the students present their project, which combines the elements named above. This provides students with an exciting view of what their future holds.

#### *Engaging Middle School and High School Students*

ISU's ESTEC organizes an annual "Ignite Their Future" summer camp for middle school and high school students held on campus [22]. The objective of the camp is to excite students about a career in a STEM-related field. In 2019, the camp included 12 strands, and served more than 100 students.

Middle school and high school teachers sign up to co-teach strands with ESTEC instructors. The week before the camp, the teachers sit with ESTEC instructors to learn the material and create/update lesson plans. The teachers earn continuing professional education (CPE) hours, and the camp offers them a stipend for their support.

Middle school and high teachers have now set foot in the ESTEC buildings, and had positive experiences with college instructors. This increases their confidence in the system, and the likelihood of them mentioning the camp to their students. Next year they may sign up to co-teach a different strand.

Content for the “Build a Raspberry Pi computer” summer camp strand is taken directly from the IT-OT Fundamentals course. While the way it is taught to middle schoolers differs from the way it is taught to undergraduate students, re-use of content offers certain convenience.

Middle school students will now have set foot within ESTEC – many years before attending a program there, hopefully influencing their attitude about attending college. Participation in the summer camp earns students preference points when they apply to the industrial cybersecurity program.

### *Engaging High School Students*

In addition to the effort and benefits described in the section above, ESTEC pays special attention to relationships with specific high school CTE instructors. The Association for Career and Technical Education claims that over 90% of high school students across the US are part of CTE [15]. This is a fantastic opportunity to identify interested students, and point them towards next steps.

ISU’s Industrial Cybersecurity program has developed a relationship with several high school CTE instructors within the region. The college instructor visits these high school instructors and their students three or four times each year. During these visits, the instructor delivers a hands-on learning activity taken directly from the ESET 181 course.

We have found that most students are easily engaged – minds and hands – in a simple cybersecurity exercise using Raspberry Pis (RPis) – which the college instructor brings to the high school classroom. The RPis are configured with SSH open and default credentials. Students warm up learning some basic Linux commands, including how to make a directory and create a file. They connect a network cable with their neighbor, and find their IP address. They use their smart phones to find the default SSH password credentials. They SSH to the other computer, and

examine the contents of the file the other student made. They then leave their own file on their neighbors' computer. Students are surprised to learn that the other person has no immediate indication that someone else is reading and leaving files. The exercise ends with a digital arms race where one student from each pair represents USA and one represents Russia. The instructor tells the students that whoever types the following command fastest will win the race and turn off the other person's computer: `sudo shutdown now`. Students yell in excitement or disappointment as half the screens go dark.

The college instructor then leads a debrief in which he asks the students to describe what lessons they learned from the exercise. "How to hack", says one. "Not to let anyone know your IP address", says another. "Change your default password", claims a third. These sincere responses offer fantastic opportunity to engage in conversation about ethics, networks, and security, respectively.

Normally, one or two students will have previous knowledge of Linux. Occasionally, a student will have previous exposure to security tools such as those included with the Kali distribution. The instructor may wish to pay special attention to these students and chat with them after class. The instructor leaves behind promotional materials and offers to set up a program tour for anyone interested.

Through this hands-on experience, high school students have actually seen a college instructor, and likely learned something from him or her. They now know how to find additional information, and can ask their high school instructor any questions they may have.

It is worthwhile for the college instructor to offer to serve on the high school instructor's advisory committee. As many high school CTE students go on for more education rather than enter the workforce directly, the college instructor offers an important perspective.

As a next step for vertical integration with high schools, ISU's College of Technology plans to adjust the ESET 181 course for a high school audience, and pilot the course for dual credit with a high school instructor. Ideally the course would also qualify as a university general education course – providing additional incentive for high school students to enroll.

### *Pathway to Bachelor*

In Fall 2019, the State of Idaho created a Bachelor of Applied Science in Cyber Physical Systems Engineering Technology (BASCPS) at Idaho State University. This pathway lays out the year 3 and 4 upper division classes for students who already have Associate degrees in the following fields, from any Idaho's six technical colleges:

- Instrumentation Engineering Technology
- Electrical Engineering Technology
- Mechanical Engineering Technology
- Nuclear Operations Technology
- Information Technology Systems
- Robotics and Communications Systems
- Civil Engineering Technology
- Diesel Onsite Power Technology

Year three of the program – which runs under a cohort model – earns the student an Intermediate Technical Certificate in Industrial Cybersecurity, and includes the courses shown in the table below. Depending on the Associate Degree the student has earned, they may substitute electives for the Industrial Operations or IT courses. The Industrial Cybersecurity courses are offered at the upper division level.

<b>Industrial Operations</b>	<b>IT</b>	<b>Industrial Cybersecurity</b>
Engineering Technology	IT-OT Fundamentals	Secure Systems Design
Energy Systems	Networking	Risk Management
Digital Control		Network Security
		Critical Infrastructure Defense
		Professional Certification
		Capstone

Year 4 of the program covers remaining general education requirements and the following upper division courses, to prepare a well-rounded professional: Technical Writing, Individual and Organizational Behavior, Project Management, Operations and Production Management, Information Assurance, Informatics & Analytics.

As demand for this program grows, ISU is implementing a competitive entry model. Candidates with actual work experience in these fields receive preference for admission.

#### *Graduate Options*

Currently Idaho State University offers two options for graduate students. First is National Information Assurance Training and Education Center (NIATEC) – a full time NSF Scholarship for Service program, where students earn a Master of Business Administration (MBA) degree in preparation for leadership-level employment within the federal government. Students who have graduated with the BASCPS are well positioned for NIATEC because they 1) have previously developed an employable skill set; 2) have rounded out that skill set with management and communications courses; 3) have significant previous exposure to cybersecurity.

The second option, under development, is an asynchronous online graduate certificate designed to meet the educational needs of full-time employees, and offered in conjunction with Boise State University. The Idaho National Laboratory offers a generous reimbursement for work-related university education. *A cycle of vertical integration*

As the cybersecurity industry grows in Southeast Idaho, ISU's graduates who have worked for diverse government entities (often on the Washington, DC area) since 2005, are now returning – many to find employment at the Idaho National Laboratory. They now serve as program advisors, guest lecturers, adjunct faculty, and hiring managers – turning vertical integration into a virtuous cycle, which our new efforts will improve over the years.

### **Future Work and Conclusion**

Vertical integration leveraging career and technical education appears a promising pathway for developing the unique combination of hands-on and academic competencies required to protect industrial infrastructures. While not all schools benefit from the CTE alignment present at Idaho State University, there is no intrinsic reason forward-thinking academic institutions cannot develop similar relationships and alignment.

Of course, successful vertical integration for industrial cybersecurity requires quality instructional capabilities, including appropriate pedagogical models, student learning outcomes, curricula design, and laboratories for hands-on instructional interventions. Future work will discuss our efforts to develop these aspects of an effective program.

We recognize that industrial cybersecurity is a global concern [27], and anticipate value in exporting this vertically integrated curricular pathway model to educational environments in other countries. Future work will need to examine its applicability in alternate educational systems.

## Appendix: ESET 181 IT-OT Fundamentals Abbreviated Syllabus

### *Course Description*

Hands-on survey of engineering technologies -- including sensors, networks, and computers -- used to drive the modern industrial economy, including the Internet, the electric grid, and potato processing facilities. Provides frameworks and vocabulary for analyzing the effects of these technologies on individuals, businesses, and nations.

### *Course Objectives*

Upon successful completion of this course, students will be able to:

- Describe operational technologies such as SCADA, HMI, PLC engineering laptop, and common ICS network communication protocols
- Describe common roles and responsibilities that deal with IT and OT within industrial environments
- Explain common information technologies used in OT, including: computer hardware, operating systems, programming, applications, networks, databases, and virtualization
- Build and interact with an elementary SCADA system
- Identify common cybersecurity concerns within industrial environments

### *Required Materials*

<b>Computer/Laptop</b>	<b>Electronic components for Raspberry Pi</b>
<ul style="list-style-type: none"><li>• Web browser</li></ul>	<ul style="list-style-type: none"><li>• Plenty of male to female jumpers</li></ul>
<ul style="list-style-type: none"><li>• University network account</li></ul>	<ul style="list-style-type: none"><li>• One set of colored LEDs (RBG)</li></ul>
	<ul style="list-style-type: none"><li>• Adafruit DHT 11 sensor</li></ul>
<b>Raspberry Pi</b>	
<ul style="list-style-type: none"><li>• Model 4</li></ul>	
<ul style="list-style-type: none"><li>• Mini HDMI to HDMI adapter</li></ul>	
<ul style="list-style-type: none"><li>• 32 GB MicroSD card with NOOBS</li></ul>	

*Weekly Schedule*

<b>Topic 1: Introduction to IT-OT Fundamentals</b>	<b>Topic 6: Supervisory Control</b>
Identify Computer Components	Turn On/Off LED using Node-RED
Rack a Server	Display Temperature trend using Node-RED
Create Process Flow Block Diagram	
Design SCADA Interface	<b>Topic 7: Intro to Networking</b>
	Explore Network Settings on Rpi
<b>Topic 2: Raspberry Pi Computing Platform</b>	Network Pi's Together
Explore BIOS/UEFI	Assign static IP address to your RPi
Make Bootable USB	
Register RPi on ISU DeviceNet Folder	<b>Topic 8: Industrial networking</b>
Navigate Command Line	Draw a network diagram
Update and upgrade Linux	Configure Cisco switch in packet tracer
Explore password files	Describe industrial switch
Add user and manage permissions	
	<b>Topic 9: IT-OT Gap</b>
<b>Topic 3: Coding</b>	Create skit demonstrating IT-OT gap
Use Turtle Python library to make a shape	
Use Turtle to make a spiral of spirals	<b>Topic 10: Network Monitoring</b>
Use Turtle to make an interactive spiral shape	Use Nmap to scan a network
Review and modify pre-written code	Install and use TCPDUMP
	IoT fingerprinting
<b>Topic 4: Cyber-Physical Systems</b>	Explore ICS network monitoring solutions
Connect LED	
Connect Temperature Sensor	<b>Topic 11: Security</b>
Create six light traffic control system	Create asset inventory
Investigate leading ICS vendors	Review and improve network architecture
	Add security to Node-RED on RPi
<b>Topic 5: Web Technologies</b>	Configure Firewall in Packet Tracer
HTML source within your Browser	Test Firewall in Packet Tracer
Create a Web Page Folder	
Explore Web Hosting Options Folder	<b>Topic 12: Future of OT</b>
Explore DNS Data Folder	Create VM in AWS cloud
Control LED from Web page	Control RPi LED from your phone
	Current events briefing
